

Maven Market Business Dashboard

Insights Report

1. Overview Page — The Big Picture

Over the full two-year period, Maven Market generated **\$1,764,546 in revenue** from **833,489 units sold**, across **269,720 transactions** and **8,842 unique customers**. Total cost of goods was \$711,728, leaving \$1,052,819 in profit and an overall margin of roughly **60%**.

Revenue increased significantly in 1998

The monthly revenue trend shows a clear difference between the two years. Revenue was around **\$565K in 1997**, compared with approximately **\$1.2M in 1998**.

The increase was fairly sudden rather than gradual. Monthly revenue went from about **\$57K in December 1997 to around \$98K in January 1998**, and then stayed mostly between **\$92K and \$101K** through much of 1998. It increased again toward the end of the year, reaching roughly **\$114K–\$120K in November and December**.

One possible explanation becomes clear when looking at the store data. In **1997, only 13 of the 24 stores** in the Stores table recorded transactions. By **1998, all 24 stores were active**. The timing aligns closely with the revenue increase, so the growth appears mainly related to the store network becoming fully active rather than a sudden change in customer behaviour.

November vs. December 1998

The latest two months in the dataset are November and December 1998. During this period:

- Revenue increased by about **5.6%**
- Units sold increased by about **5.4%**
- Cost increased by about **5.6%**
- Unique customers decreased slightly by about **0.4%**

So, even though revenue increased, the number of customers did not. This suggests that the December increase came more from existing customers purchasing additional units rather than from acquiring more customers.

Regions and store types

North West is the strongest sales region, generating **\$847,827 in revenue**, which is almost half of the company's total. It is followed by **Mexico Central at \$330,362** and **South West at \$320,805**.

At the other end, **Central West** generates only **\$9,325**, making it the weakest region by a large margin. This would be worth investigating further to see whether the region has very few stores or whether there are other factors behind the low sales.

Looking at store formats, **Supermarkets account for 372,699 units sold**, while **Deluxe Supermarkets account for 316,671**. These two formats clearly make up most of the sales volume. **Small Grocery** stores are at the bottom with **15,999 units sold**.

At the brand level, **Hermanos** is the top performer, generating **\$56,659 in revenue and \$33,167 in profit**, slightly ahead of Tell Tale and Ebony.

By country, the USA has the highest number of units sold with **555,899**, followed by **Mexico with 226,838** and **Canada with 50,752**.

2. Product Detail Page — What's Selling

The Product Detail page takes the analysis down to individual products. It also includes two product attributes that aren't shown on the Overview page: **low-fat** and **recyclable packaging**.

Top products by revenue

Product	Revenue	Profit
Hermanos Green Pepper	\$2,489.70	\$1,670.55
Hilltop Mint Mouthwash	\$2,447.12	\$1,493.96
Carlson Head Cheese	\$2,417.73	\$1,254.54
Great Pumpernickel Bread	\$2,408.56	\$1,326.64
Fabulous Strawberry Drink	\$2,377.90	\$1,474.90

The top five products are surprisingly close to each other. The difference between the highest and fifth-highest product is only about **\$110 in revenue**.

So, unlike the brand-level view where Hermanos stands out, there doesn't seem to be one individual product dominating sales. Revenue is spread across a fairly wide range of products.

Low-fat and recyclable products

Regular products generate **\$1,142,314 in revenue**, compared with **\$622,232 for low-fat products**. In this dataset, regular products therefore generate almost twice the revenue of low-fat products.

For recyclable packaging, the difference is smaller. **Recyclable products generate \$1,005,174**, compared with **\$759,373 for products that are not recyclable**.

The recyclable category being ahead is worth noting because the difference isn't as large as it might appear from simply looking at the two pie charts.

3. Customer Detail Page — Who's Buying

The Customer Detail page looks at the customer base from a few different angles, including education, occupation, location, membership tier and individual customer performance.

Education level

The revenue breakdown by education level was different from what I initially expected. Customers with a **Partial High School** education generate the most revenue at **\$533,189**, followed closely by customers with a **High School Degree** at **\$521,723**.

Customers with a **Graduate Degree** generate the least revenue at **\$93,648**.

However, I wouldn't interpret this as meaning that customers with less education spend more. The difference could simply be because there are more customers in some education categories than others. Customer counts would need to be compared alongside revenue before concluding spending behaviour.

Occupation and geography

Professional is the largest occupation group with **2,896 customers**, followed by **Skilled Manual** with **2,296** and **Manual** with **2,220**. **Clerical** is the smallest group with **172 customers**.

Looking at customer location, **California** has the largest customer base with **3,274 customers**, followed by **Washington** with **2,034** and **British Columbia** with **1,380**.

The highest-revenue individual customer is **Ida Rodriguez**, with **\$2,235.43 in revenue from 1,021 units**. The top ten customers are relatively close together, with revenue ranging from roughly **\$1,750 to \$2,235**.

Loyalty tiers

The member-card distribution is heavily weighted toward the **Bronze** tier. There are **5,703 Bronze customers out of 8,842**, which is around two-thirds of the total customer base.

There are **1,198 Golden customers** and **960 Silver customers**.

If these membership levels represent an actual loyalty program with different benefits by tier, the large Bronze customer base could be an area worth exploring from a marketing or retention perspective.

One useful consistency check is that **Hermanos** also has the widest customer reach, with **4,154 distinct buyers**. This is consistent with its position as the leading brand by revenue on the Overview page.

4. Store Detail Page — Where It's Happening

The Store Detail page focuses on location, store format and the relationship between store size and revenue.

Revenue by location

Washington is the strongest state by revenue, with stores generating **\$562,093**. California generates **\$330,130**, while Oregon generates **\$285,734**.

Outside the US and Canada, **Zacatecas, Mexico** is the strongest performer, generating **\$165,663** in revenue.

Store format and return rates

Store Type	Revenue	Return Rate
Supermarket	\$789,601	1.01%
Deluxe Supermarket	\$669,727	1.02%
Gourmet Supermarket	\$152,980	0.97%
Mid-Size Grocery	\$118,534	1.07%
Small Grocery	\$33,704	0.00%

Return rates are fairly consistent across most store formats, staying close to **1%**.

Small Grocery stores are different, showing a **0.00% return rate**. I wouldn't automatically treat that as evidence that smaller stores have fewer returns, though. These stores also have much lower sales volume, so the result could simply be related to the smaller number of transactions or units. It's something I'd flag for further investigation rather than draw a firm conclusion from.

Store size doesn't seem to explain revenue

One of the more interesting results on this page comes from the **Store Size vs. Revenue** scatter plot.

The correlation between store size and revenue is **-0.16**, which suggests there is essentially no positive relationship between the two variables. If anything, the relationship is slightly negative.

For example, **Store 13** is the highest-revenue store at **\$170,399**, but it has only **27,694 square feet**. Meanwhile, **Store 3** is the largest store at **39,696 square feet**, but generates **\$110,878**, ranking seventh.

This suggests that simply having a larger store does not appear to be enough to explain higher revenue. Other factors are likely contributing to the performance of stores such as Store 13 and Store 17.

Top cities by units sold

The cities with the highest unit sales are:

1. **Salem — 80,762 units**
2. **Tacoma — 74,347 units**
3. **Seattle — 54,865 units**
4. **Portland — 54,526 units**
5. **Hidalgo — 52,888 units**

Closing Thoughts

Looking across all four pages, the biggest takeaway is that Maven Market's strong growth in **1998 appears to be closely connected to the store network becoming fully active**. The number of active stores increased from 13 in 1997 to all 24 stores in 1998, which lines up closely with the jump in revenue.

A few other areas stood out:

- **Bronze customers make up a large share of the loyalty base**, which could be worth exploring further.
- **Central West has much lower revenue than the other regions** and deserves a closer look.
- **Store size does not appear to be a good predictor of revenue**, based on the -0.16 correlation.
- **Small Grocery stores show a 0% return rate**, although the lower sales volume means this should be treated cautiously.
- The education-level revenue differences should also be checked against customer counts before making any conclusions about customer spending behaviour.
